2005 ASCA Nationals!

In This Issue:

- ❖ Secretaries Report
- ❖ 2005 ASCA Finalists
 - Stockdog Finalists
 - Obedience Finalists
 - Agility Finalists
- ❖ Crystal Jubilee Conformation
- ❖ National's volunteer sign-up
- ❖ Health Corner
- ❖ Membership Renewal form
- ❖ Brags
- ❖ Paid Advertisements

Aussie News is the official publication of the Greater Atlanta ASC and is published six times a year: January/February, March/April, May/June, July/August, September/October, and November/December. Ads, Brags, Photo of the month, Letters to the Editor, etc. are due to the editor by the 15th of the month prior to the publication date.

Mail to: Wendy Eldredge, 155 Reynolds St., Marietta, GA 30064, 770-429-9103, eldredge@bellsouth.net

Secretary's Report

GAASC BoD

Meeting 07/09/05

12:30 pm

In attendance:

Cheryl Padgett, Amy Burnette, Renee Reschenthaler, Robert Wheaton, Terry Dickey, Debbie Anderson, Wendy Eldredge

Old Business:

- Amy Burnette retracts her resignation as President. Accepted Unanimous
- Meeting notes from March accepted
- Outstanding invoices from Apparel Manufacturing – Motion/ Anderson, Second/Wheaton to hold bill on Renee Reschenthaler's cc until next meeting. Club will cover all finance charges in the interim. Unanimous.
- Some copies of records regarding disputes surrounding Allison Bryant at attorney Merlin's office. Motion/Burnette. Second/ Dickey - to NOT obtain those copies Unanimous
- Formation of By-laws committee – pended
- List of seminars to be provided to ASCA BoD – pended

New Business

- BoD confidentiality discussed – consensus that all BoD business remain within BoD until vote to publish.
- Empty VP position – Motion/ Burnette, Second/Padgett – to install Terry Dickey as VP for remainder of term. Unanimous
- Begin work on BoD procedures manual
- Motion/Burnette, Second/ Anderson – to leave trailers stored as currently arranged.
- Next scheduled BoD and general membership meeting to coincide with club work day on August 20, 2005 at Renee's home.
- Motion/ Reschenthaler, Second/Anderson – proceed w/shadow boxes @ 225/200 – unanimous
- Motion/Burnette, Second/Anderson - 'You deserve the credit' change to tokens offered for amount worked
- Sharon Willis will act as volunteer coordinator? Reschenthaler to follow up.
- Post Trial approved w/ARPH
- Volunteer sign up form to be placed on Nationals website
- Nationals event chairs to provide list of who/where/when for volunteer coordinator
- Stock handler contracts voided with Wright, Christensen, and Hines.
- Stock handler contract still open with Roby – Reschenthaler to follow up and offer/request 3 days.

No further business to discuss the meeting is adjourned 1:45 pm

GAASC General Membership meeting 08/20/05

11:25 am

Treasurer's report: Regular club account balance is \$23,691.45. Nationals account balance is \$98,716.61. Nationals account is on track to covering expenses.

New Business:

New members: Pat Pierce/Alpharetta, Kelly Dodd/Madison, Jarilyn Waits-Pusz/Kennesaw, Emily & Gary Chapman/Lawrenceville, Don & Kim Gatewood/Rincon, Dean Jennins/Monroe, Glenda Stephenson/Palm Bay FL.

Motion to accept/Eldredge, Second/Dickey, approved unanimously

Old Business:

SE Regional – Pend for further information:

Chicopee to Expensive

Newnan Kennel Club – unknown

Henderson Arena – cannot contact

Jim Miller/ Wills Park – too expensive or unavailable

North Ga Convention Center (Dalton) – unknown – Wendy Eldredge to follow up

Trailer storage – pend until after Nationals

Secretary's Report (continued)

Trailer tags – all trailer tags to be registered in Cherokee County. Amy Burnette to follow up.

Paw Thaw – discussion on AOC location vs Dogwood vs Canine Capers. Would like to have two ring soft obedience. Renee to follow up.

Motion by Amy Burnette to purchase 120 pre-made tracking flags in a variety of colors at an approximate cost of \$390. Second by Renee, motion approved.

Further discussion on having custom flags made for start flags which will act as participants gift (duplicate made as gift to track layers). Pat Pierce to investigate flag construction. Amy Burnette to investigate embroidery on the flags as well as embroidery on glove articles.

No further business to discuss, meeting adjourned at 12:10 pm

GAASC 2005 Nationals Committee meeting 08/20/05

12:15 pm

-Amy Burnette to follow up with Glenda Stephenson on decorations

-Juniors prizes – Glenda already has some. Follow up?

-Menu for Tuesday night awards presentation (?) – peach cobbler, hors d'oeuvres, cash bar, sodas

-Menu for Wednesday's Peach Invitational – cake, champagne punch

-Daily newsletter during National's? Melinda (our office manager for nationals) will take care of.

-Add link to GA Navigator and back road directions to the confirmation letter.

-Raw food seminar/booth charge? Put all seminar/health fair booths all together.

-Judges travel – Terry Dickey reports that tickets are either all ready purchased or are coming along.

-Approach ASCA for finals entry fees from all venues.

- Agility – judges are hired & contracted

- need a large enclosed tent for workers, computers, etc. Motion/Anderson, Second/Eldredge, approved unanimously.

Discussion to Purchase 3 EZ ups for use during Nationals to be raffled to volunteers (not paid help)

Cheryl and Renee to get together to place ribbon order.

Discussion of materials needed to construct Duck arena. Renee to make purchases.

Wendy Eldredge to place ad with Market Bulletin for sale of ducks after Nationals. Also to contact local newspapers/radio/television regarding coverage.

Banquet menu selected. DJ yet to be hired.

Reserved parking will be made available to agility contestants on roadway along side agility arena.

No further business to discuss, meeting adjourned at 1 pm

GAASC BoD meeting 08/20/05

2:30 pm

In attendance:

Cheryl Padgett, Amy Burnette, Renee Reschenthaler, Terry Dickey, Robert Wheaton, Wendy Eldredge, Debbie Anderson

Motion to install Georgie Blackburn as Director, filling vacancy. Motion/Padgett, Second/Eldredge, approved unanimously

Motion to utilize the Horse Park's radio station from dusk to dawn during Nationals at flat rate of \$50 for the week. Motion/Anderson, Second/Eldredge, approved unanimously

Wendy Eldredge will burn music CD's to play in background during events. A volunteer will be solicited to act as announcer.

Motion for GAASC to donate belt buckle for Reserve Stockdog Finalist. Motion/Padgett, Second/Eldredge, approved unanimously. The BoD then reviewed the buckle designs available and the different price points following this motion. Designs were decided upon and Renee Reschenthaler is to place the order.

No further business to discuss, the meeting is adjourned.

Secretary's Report (continued)

Board Business 07/09/05 – 09/09/05

Motions and approvals

-Motion/Burnette- to hold tracking test 11/19-20/05, Second/Reschenthaler. Unanimous.

Terry Dickey to chair & secretary

-Motion/Padgett – to donate ad space to ASHGI and AussieGENES– Second/Krall. Unanimous

-Motion/Burnette, Second/Kral – invite A.J.Carubi to fill empty board position. Unanimous (follow up – Mr. Carubi has declined)

-Motion/Wheaton, Second/Anderson – to approve Tracking judges contracts. Unanimous

-Motion/Burnette, Second/Anderson – to reimburse speaker from UofMo travel expenses surrounding Epilepsy & Phenome Project Seminar at Nationals. Approved

-Motion/Reschenthaler, Second/Burnette – to reimburse Renee for cost of painting/refurbishment supplies for obedience/agility equipment. Unanimous

-Motion/Wheaton, Second/Eldredge – Treasurer to send payment of \$3000 to Imagmaker for plaques. Approved – Wheaton, Reschenthaler, Dickey, Anderson, Kral

-Motion/Padgett, Second/Dickey – to purchase close out crate buckets from PetSmart. Approved

-Motion/Eldredge, Second/Anderson – to use Agility and Stock designs on award plaques but not print shirts until future date. Approved Reschenthaler, Kral, Dickey, Wheaton

-Motion/Burnette, Second/Reschenthaler - to rent 2 golf carts in addition to the one Queen Sales is donating to us during Nationals. Approved Reschenthaler, Wheaton, Dickey, Eldredge, Anderson

-Motion/Burnette, Second/Eldredge –to donate \$500 through PetSmart charities earmarked for animals affected by hurricane Katrina. Approved Reschenthaler, Padgett, Wheaton, Anderson, Kral, Dickey, Eldredge

-Motion/Padgett, Second/Eldredge – to install Georgie Blackburn as GAASC Director for remainder of term vacated by Terry Dickey upon her installation as VP. Approved unanimous

-Motion/Burnette, Second/Reschenthaler – to purchase 120 tracking flags for tracking tests at approximate cost of \$390. Approved Reschenthaler, Eldredge, Padgett, Dickey, Blackburn, Wheaton, Anderson

-Motion/Padgett, Second/Eldredge – to donate belt buckle for 2005 ASCA Stockdog Finals Reserve. Approved Reschenthaler, Eldredge, Anderson, Padgett, Wheaton, Dickey, Blackburn

-Motion/Eldredge, Second/Anderson – Cheryl Padgett to purchase white boards and markers as needed for Nationals.

-Motion/Anderson, Second/ Eldredge – to purchase radio air time (dawn to dark) through the Horse Park during the week of Nationals at a cost of \$50. Approved unanimous

-Motion/Anderson, Second/Eldredge – to rent enclosed tent for use of agility workers during week of Nationals at cost of ~\$700. Approved unanimous.

-Motion/Eldredge, Second/Dickey – to offer along with a gift certificate (value and source to be determined) the following awards for Junior Handlers at Nationals

- ❑ **High Overall Junior – Shadowbox**
- ❑ **High working Junior – Belt Buckle**
- ❑ **High Obedience – Leash rack**
- ❑ **MVJ – Belt Buckle**
- ❑ **High Agility –to be determined**

Approved unanimous

-Motion/Burnette, Second/ Eldredge-to publish GAASC BoD motions and votes in the next available club newsletter. Approved unanimous

The Health Corner

This continues a multipart series on Canine Reproduction

Pamela A. Davol, Swansea, MA

Part 3: Medical Management of Complications Affecting Delivery (Whelping)

Complications that arise during pregnancy and whelping are infrequent but when they do occur may constitute immediate and life-threatening situations to both the dam and the puppies. Early recognition of warning signs followed by immediate medical treatment goes far in preventing fatality to the dam as well as increasing the survival of the puppies.

Complications That May Develop During Whelping
primary uterine inertia
pre-eclampsia/eclampsia (hypocalcemia)
uterine torsion or rupture
hemorrhage
pelvic canal obstruction (i.e. anatomical or due to fetal over-size)
premature placental separation
fetal distress

Warning Signs of Whelping Complications

Circumstances for Having the Dam Examined [Status: Non-Emergency]
<ul style="list-style-type: none"> The bitch has reached her estimated due date and there has been no body temperature decrease or signs of labor.
<ul style="list-style-type: none"> There are no signs of first stage labor (uterine contractions/cervix dilation) within 12-18 hours of a body temperature decrease.

Circumstances Requiring Immediate Medical Evaluation [Status: Emergency]	Potential Cause
<ul style="list-style-type: none"> The bitch has failed to progress to second-stage labor (delivery of pups) after 6-8 hours of first stage labor 	obstruction
<ul style="list-style-type: none"> No pups have been whelped, but the bitch is passing thick, black-green discharge from the vulvar 	premature placental separation
<ul style="list-style-type: none"> The bitch is passing a heavy, persistent flow of fresh blood from the vulvar 	hemorrhage, uterine rupture
<ul style="list-style-type: none"> The bitch experiences muscle weakness, muscle-spasms, muscle-tremors, or muscle-rigidity, or seizures 	eclampsia (hypocalcemia)
<ul style="list-style-type: none"> The bitch has been straining for more than 20 minutes or has had weak intermittent abdominal contractions for 1 hour but has not produced a pup or has only expelled membranes 	obstruction

<ul style="list-style-type: none"> • It has been more than 1 hour between delivery of pups with no further sign of active labor, yet it is known that there are more pups 	uterine inertia
<ul style="list-style-type: none"> • The bitch demonstrates evidence of intense abdominal pain and symptoms indicative of shock such as pale mucus membranes, rapid and thready pulse, sudden drop in body temperature (below the 99°F associated with whelping) or collapse 	uterine torsion

When contacting your veterinarian be prepared to answer the following questions:
<ul style="list-style-type: none"> • Bitches' age
<ul style="list-style-type: none"> • Breed
<ul style="list-style-type: none"> • Reproductive history (previous litters? prior cesarean delivery?)
<ul style="list-style-type: none"> • Previous or chronic medical conditions and treatments
<ul style="list-style-type: none"> • What was the date of bitches' preovulatory serum progesterone/LH peak?
<ul style="list-style-type: none"> • When did the bitch last eat and/or drink?
<ul style="list-style-type: none"> • Has she vomited?
<ul style="list-style-type: none"> • Has she urinated/defecated?
<ul style="list-style-type: none"> • Has oxytocin been administered?
<ul style="list-style-type: none"> • What is the color of the vaginal discharge?

When it is necessary to transport the bitch, any puppies that have already been whelped should be taken along. Puppies should be placed in a laundry basket or box layered with towels. Water bottles filled with "warm" water (not hot) can be placed in the basket to keep the pups warm. It is helpful to have another person do the driving so that the breeder/owner can assist the bitch if she should deliver another puppy on the way to the veterinary hospital.

Assessment of the Dam

Evaluation of the "Overdue" Bitch

In the absence of preovulatory screening for serum progesterone/LH peak, estimations of due date can be quite variable ranging from 57 to 72 days from the original breeding date. In most cases when ovulation date has not been accurately determined by serum testing, the estimated due date is usually incorrect and whelping will proceed normally once gestation is complete (63±1 days from the actual date of ovulation). In non-life-threatening situations in which a bitch is considered overdue, prior to performing cesarean delivery, serum progesterone levels should first be quantitated to prevent the possibility of surgical delivery of premature pups. High serum progesterone levels (above 2 ng/ml) would be indicative that gestation is incomplete and contraindicate the use of cesarean surgery. As a precaution, however, fetal monitoring may be employed to ensure the well-being of the fetuses (see "Fetal Monitoring" below).

Special note regarding pregnant bitches undergoing treatment for progesterone insufficiency: Bitches that are receiving exogenous progesterone therapy for treatment of insufficient luteal phase will not demonstrate a decrease in serum progesterone until therapy is discontinued. In such cases, timing of progesterone withdrawal is critical for the well-being of the puppies. Administration of

gestation term, labor does not occur and the fetuses will die. Therefore, accurate ovulation date and subsequent calculation of gestation period is critical when scheduling progesterone therapy.

Management of Emergency Conditions

Time is of the essence when evaluating emergencies associated with pregnancy and whelping. Any immediate, life-threatening conditions affecting the bitch must receive priority medical attention to avoid the potential of losing the dam as well as the pups.

In instances where the bitch is not in immediate danger, a thorough evaluation will include both an assessment of the bitch and assessment of the fetuses. The veterinarian will quickly perform an examination of the bitch concentrating on the reproductive system. An internal exam will reveal whether or not a puppy is lodged in the vaginal tract. If so, the veterinarian may attempt to assist delivery if conditions are favorable (i.e. if the pup is not too large or malpositioned). If there is no evidence of obstruction, the veterinarian will continue with the examination, checking the bitches' temperature, pulse, respiration, heart rate, blood-oxygen levels (mucus membrane color and capillary refill time), hydration, and pupillary response. Palpation of the abdomen and uterus will allow the vet to determine evidence of abdominal pain (that may be indicative of uterine torsion or rupture) and evaluate the presence and positions of fetuses, respectively. The entire physical examination and evaluation of the bitch should take no more than about 5 minutes.

Fetal Monitoring. To prevent fetal mortality in cases of complicated deliveries, it is critical that fetal monitoring be performed. For this reason, it is recommended that fetal monitoring commence as soon as the initial examination of the bitch is completed (within 10 minutes of presentation at the veterinarian office). Evidence of fetal distress (indicated by heart rates lower than 150 beats per minute [bpm]) is a good indication that immediate surgical intervention utilizing cesarean section is required (in place of further diagnostics or allowing the bitch more time to progress in labor) to ensure fetal survival. Fetal monitoring is performed using transabdominal ultrasound. The chest cavities of the pups are located on ultrasound and heartbeats of each pup are counted for 15 seconds then the result multiplied by 4. Pups with heartbeats calculated above 150 bpm (ideally closer to 200 bpm) are considered to be uncompromised. If fetal monitoring indicates that none of the puppies are experiencing distress, then this will allow a window of opportunity for the veterinarian to perform further diagnostics and/or attempt a more conservative approach of assisted delivery.

Fetal monitoring is also indicated in non-emergency situations particularly in over-due bitches. Monitoring will provide assurance that the fetuses are uncompromised or identify fetal stress, which would indicate the need for immediate surgical intervention. For breeders/owners who wish to perform routine fetal monitoring at home, Veterinary Perinatal Specialties of Wheat Ridge, CO offers the [WhelpWise](#) service for monitoring uterine contractions and individual heart rates.

Diagnostic Approaches

Once fetal monitoring indicates that the fetuses are in no immediate danger, the veterinarian will have time to run further diagnostics that will in most cases identify the cause of why the labor has failed to proceed normally. Routine diagnostics include the following:

Blood work. Because many bitches may become dehydrated or hypoglycemic during delivery or may experience internal hemorrhage, blood analyses to determine packed cell volume (PCV), total protein, blood glucose, and nitrogen waste products in the blood will assist the veterinarian in diagnosing such conditions. Additionally, these tests are also helpful in identifying bitches with underlying conditions that may necessitate cesarean section even in the absence of acute delivery complications. Blood work results indicative of dehydration or hemorrhage will necessitate the use of intravenous fluid therapy.

Excessive panting during labor may result in metabolic disturbance of serum calcium levels. Even slight decreases in serum calcium can result in inefficacy of muscle contractions that may slow the progress of labor. Therefore, if the veterinarian has access to in-house serum calcium testing, this assessment is recommended. In absence of testing, but in the presence of symptoms suggestive of low calcium levels, many veterinarians will administer calcium supplement to compensate for the metabolic imbalance.

Radiographs. Ideally, two views of the abdomen by survey radiography (x-ray) are usually sufficient for determining the number, size (in relation to the dam's pelvis), and position of fetuses as well as detect fetal death (skeletal collapse). As such, radiographs are helpful for distinguishing between conditions that may be managed by conservative approaches (i.e. obstetrical manipulation, oxytocin, calcium supplementation) and those that require surgical intervention (cesarean delivery).

Management of Fetal Obstruction (Dystocia)

within the birth canal. This situation may occur when:

- 1) a puppy is over-sized,
- 2) a puppy is malpositioned, or
- 3) two puppies are presenting at the same time.

During the initial examination of the bitch, if a puppy is found to be obstructing the birth canal, the veterinarian will quickly determine by noting size, positioning, and strength of the bitches' contractions if assistance by manipulation of the puppy or puppies is a feasible alternative to surgical intervention. In some cases the veterinarian may be able to assist the bitches' contractions by gripping (with fingers only; forceps are not recommended) the puppy under the mandible or around the shoulders (if the puppy is presenting in the head-first position) or around the hocks or pelvis (if the puppy is presenting in the feet-first position) and applying gentle tension as the bitch pushes to expel the puppy and continuing the tension between contractions to prevent the puppy from slipping back to its previous position. When size is a contributing factor to delaying progression of birth, the vet will often gently stretch the tissues of the vaginal wall in an attempt to widen the birthing canal in front of the puppy. If the vulvar opening is too narrow, an episiotomy may be performed. The vet may also stimulate contractions by "feathering" (applying gentle, backward scrapping with a finger) the vaginal wall; this may be particularly helpful to move a puppy that may be just out of reach to a position where it may be grasped by the veterinarian. Other strategies may include elevating the bitches' forelegs and chest, which will occasionally move a puppy within reach. If two puppies are presenting at the same time, elevating the hindquarters may move the second of the puppies back into the uterus and allow room for the first puppy to proceed.

When attempting assisted delivery, if progress is not evident within 10 minutes, fetuses should be monitored for signs of distress. When fetal monitoring indicates the absence of fetal distress, then there is time for the veterinarian to make another attempt at assisting delivery. Any evidence of fetal compromise, however, contraindicates any further attempts for vaginal delivery and cesarean delivery is the recommended course of action. Additionally, because of the potential for foreign bacteria to be introduced into the vaginal canal during obstetrical manipulation and the subsequent risks of systemic infection, prophylactic antibiotics should be routinely administered to bitches in which this approach has been employed.

Use of Oxytocin. Oxytocin is a naturally occurring hormone in the bitch that induces uterine contractions. Suckling stimulates the release of endogenous oxytocin. Therefore, to increase contractions and speed-up the progress of labor, it is recommended that newborn puppies be allowed to nurse between subsequent deliveries. When endogenous levels of oxytocin are not sufficient to stimulate effective uterine contractions, exogenous oxytocin treatment is often successful in increasing the efficacy of contractions. However, certain criteria must be present for the safe and effective use of oxytocin treatment in a pregnant bitch.

Safe Criteria for Use of Oxytocin in Bitches with Ineffective Uterine Contractions:	Conditions that Contraindicate the Use of Oxytocin
<ul style="list-style-type: none"> • the cervix is dilated 	<ul style="list-style-type: none"> • the bitch is already demonstrating strong uterine/abdominal contractions
<ul style="list-style-type: none"> • there are no vaginal obstructions (fetal or anatomical) 	<ul style="list-style-type: none"> • uterine inertia
<ul style="list-style-type: none"> • the dam and puppies are stable 	<ul style="list-style-type: none"> • the cervix has not fully dilated
	<ul style="list-style-type: none"> • presence of an obstruction (fetal or anatomical)
	<ul style="list-style-type: none"> • depressed fetal heart rates (i.e. fetal distress)

Bitches that are already having strong contractions but are failing to progress through labor are unlikely to benefit from administration of oxytocin; additionally oxytocin will not induce contractions in bitches suffering from uterine inertia (inability of uterine muscles to contract due to energy depletion). Because administration of oxytocin promotes placental separation, giving oxytocin to a bitch in which the cervix has not yet dilated or in cases where a puppy is lodged in the birth canal will increase the chances of oxygen deprivation to fetuses in the uterus and may result in fetal compromise and death. Accordingly, in instances of obstruction when attempts at assisted delivery fail or in cases where fetal distress is clearly evident, there is no time for administration of oxytocin and cesarean delivery is the recommended course of action.

Use of Calcium. For proper function and response, neuromuscular tissues are dependent upon a normal balance of electrolytes within the body. In particular, uterine contractions are dependent upon adequate levels of calcium. In cases where calcium metabolism has been compromised (i.e. by inadequate diet, by dietary supplementation of a nutritionally balanced diet with exogenous calcium during pregnancy, or by extended periods of uterine contractions as seen in long deliveries), mildly depleted levels of serum calcium within a whelping bitch may inhibit the normal progression of delivery by interfering with uterine contractions; more compromised levels often present life-threatening complications in the form of tetany and seizures.

Bitches presenting with weak uterine contractions can be screened for serum calcium levels. In the absence of available, in-house calcium testing, a veterinarian recognizing symptoms representative of low-calcium levels may choose to supplement the bitch with exogenous calcium in an effort to strengthen uterine contractions. In this situation, calcium supplement will be administered by a subcutaneous injection. Because of the potential dangers associated with intravenous administration of calcium (cardiac arrhythmias and sudden death), intravenous administration of calcium is only recommended when a bitch presents with clinical symptoms of life-threatening hypocalcemia (indicated by: muscle spasms, tetany [muscle rigidity] or seizures), or if low serum calcium levels have been confirmed by laboratory analysis.

Use of Intravenous Fluids. Not all bitches that experience whelping complications will require therapy with intravenous fluids. Since dehydration can lead to fetal distress by compromising the placental exchange of oxygen and nutrients, bitches that demonstrate excessive vomiting during labor or are showing evidence of dehydration will require intravenous fluid therapy. Additionally, because surgery will lead to a hypotensive state in the bitch both during and following the procedure, bitches that undergo cesarean surgery will also require treatment with intravenous fluids.

Other Supportive Measures. Anxiety and fear are factors that may also slow the progression of labor in the bitch. It is, therefore, essential that labor proceed in a quiet and comfortable environment for the bitch. Ideally, the owner/breeder, for whom the bitch has previously established a trusted bond, should monitor the progress of the delivery. If it becomes evident that the progression of normal labor is slowing down, short, attended, leash walks to allow the bitch to urinate and/or defecate may assist in speeding-up delivery. Ice cubes and Karo syrup may also be offered to the bitch to prevent dehydration and restore depleted blood sugar levels, respectively. Larger quantities of water or food, however, should be avoided until labor and delivery are completed (in the event that emergency surgery is required). In instances of complications, transfer of the bitch to a medical facility should be made as smoothly and with as little disruption as circumstances allow.

Indications for Cesarean Section

Though conservative medical management of complications may sometimes result in successful outcome, there are some situations that require immediate surgical intervention to prevent demise of the dam, fetuses or both. The following are

Conditions Warranting Undelayed Cesarean Section:
• Uterine inertia unresponsive to oxytocin or calcium supplement
• Fetal oversize of one or more pups in relation to the dams pelvic width
• Anatomical obstructions of the birth canal (i.e. soft tissue or bony obstructions)
• Fetal malposition that precludes vaginal delivery
• Uterine torsion or rupture
• Depressed fetal heart rates (below 150 bpm) upon initial exam
• Good initial result of fetal heart rate (greater than 150 bpm) but subsequent monitoring indicates a progressive or sudden deterioration of heart rate (to less than 150 bpm)

Occasionally, conditions warranting elective cesarean section may be identified prior to breeding or during the pregnancy. Under such

Additionally, exact date of ovulation by serum progesterone/LH testing is recommended for accurate assessment of the due-date and prevention of surgical delivery of pre-mature puppies. If the ovulation date has not been determined, an alternative approach is to monitor daily serum progesterone concentration beginning 3-5 days prior to the earliest, "best estimated" due date. Decrease in serum progesterone levels signal the end of gestation and will provide the surgeon with some assurance that the puppies are full-term prior to proceeding with elective surgery.

Conditions Indicative for Scheduling Elective Cesarean Section:
<ul style="list-style-type: none"> • The bitch has a history of uterine inertia, complicated deliveries, or cesarean section
<ul style="list-style-type: none"> • The bitch has a congenital or traumatic malformation that has narrowed the birth canal
<ul style="list-style-type: none"> • A breed or family history of over-sized fetuses
<ul style="list-style-type: none"> • Radiographs taken in the last weeks of pregnancy indicate fetal over-size in one or more puppies

Medical Management of Retained Dead Fetuses and Fetal Membranes

In instances where surgical intervention is warranted but is delayed, fetal death will occur. If the dead fetuses are not spontaneously expelled from the uterus (a process that is typically impeded for the same reasons that prohibited normal delivery), the life of the bitch will be endangered. Decomposing fetal debris within the uterus places the bitch at high risk for developing systemic bacterial infections that in the absence of treatment will lead to her death. Surgical evacuation of the uterus is the optimal method of treatment for this condition. In situations where the underlying health of the bitch contraindicates surgical intervention or the breeder/owner refuses surgical intervention, intravenous fluid therapy and administration of broad-spectrum antibiotic therapy is the alternative, but often less effective approach.

Occasionally during delivery, a vigilant breeder/owner may notice that a placenta did not follow the birth of a puppy, or the breeder/owner may be unsure given the fact that sometimes the placenta is retained, later passed, but consumed by the bitch before the breeder/owner is aware. In many bitches, one or two retained membranes will not result in any clinical problems, however, in others infections may result. Typically, a bitch with retained membranes will have a heavier than normal bloody discharge subsequent to the completion of delivery. For those breeders/owners who prefer to monitor the bitches' condition in lieu of seeking immediate medical intervention, continual monitoring of the bitches' rectal temperature and examination of the vaginal discharge for any evidence of foul-smelling or pus-like material is advisable. Sudden lethargy, fever, or loss of appetite are considered warning signs that are usually indicative of a bacterial infection. Because severe systemic bacterial infection may result in some bitches, it is perhaps a good practice that all bitches known or suspected to have retained fetal membranes receive treatment for this condition.

Once radiographs have been taken to confirm that all the puppies have been delivered, administration of exogenous oxytocin will usually induce the delivery of retained membranes. Because the membranes may be delivered within a variable amount of time following administration of oxytocin and consumed by the bitch, it is not always feasible for a breeder/owner to be sure that the membranes have been passed. Therefore, prophylactic administration of antibiotics over a 7 to 10 day period and continued monitoring of the bitch for warning signs of infection (as indicated above) is typically the preferred approach for management of this condition. Cephalosporin is a broad-spectrum antibiotic typically used in this situation because it demonstrates efficacy against numerous bacterial strains and appears to be safe to nursing puppies.

*2005 Crystal Jubilee
Conformation Invitational
Wednesday, October 26, 2005
Georgia International Horse Park, Walker Arena,
Conyers, GA*

*Senior ASCA Breeder Judges
Andrea Blizzard
Terry Martin
Sharon Rowe*

This competition is designed to showcase ASCA's top-ranked conformation dogs and bitches.

Eligible dogs will be those dogs and bitches ranking in the top 30 of the Intact and Altered ASCA Merit Programs for the period June 1, 2004 to May 31, 2005. A waiting list of dogs 31 - 50 on their respective list will be maintained in the event that any of the eligible dogs elects not to attend. Intact and Altered will compete separately.

*For detailed information on entry and judging requirements, visit
<http://www.gaasc.org>*

Brag About It

Renee Reschenthaler says:

I'm so proud of my little girl, Maddie. She finished her WTCH this past weekend at the ASTASA Labor Day Weekend trial. She needed just a duck leg and a sheep leg. She's having some confidence issues with the Advanced distance, but we're working our way through it. I'm really tickled that she will be the ONLY dog in the Crystal Jubilee Conformation Invitational with a WTCH. She's such a wonderful little dog. Many thanks to Cheryl & Tony Padgett for letting her come live with us.

And also from Renee:

Jasper has two new titles to crow about as well. He finished his Advanced cattle and ducks at the ASTASA Labor Day Weekend trial. He also earned HIT Ducks at one of the trials. Thanks to Devona Myrick, his breeder, for working with him while I've been tied up with all the Nationals stuff.

Debbie Anderson writes:

A-CH Arboretum's Enchanted Forest HCTs earned his first Started Sheep leg this past weekend at the ASTASA herding trial. I am very proud of both Gary and Forest. This was the first trial that either has competed in. I would also like to thank Devona Myrick for all her help over the past few weeks. Since we have no stock at home Gary and Forest have been going to Devona's for the past few weeks for instructions.
